Toshimitsu Takaesu

This article is a short review of a ground state of a model of quantum electrodynamics in [13]. We investigate a system of a quantized Dirac field coupled to a quantized radiation field in the Coulomb gauge. The classical Lagrangian density is given by

$$\mathcal{L}_{\text{QED}} = -\frac{1}{4}F^{\mu\nu}F_{\mu\nu} + \bar{\psi}(i\gamma^\mu D_\mu - M)\psi,$$

where $F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu$, $D_\mu = \partial_\mu - eA_\mu$ and $\bar{\psi} = \psi^\dagger \gamma^0$. We define the Hilbert space for the system by $\mathcal{F}_{\text{QED}} = \mathcal{F}_{\text{Dirac}} \otimes \mathcal{F}_{\text{rad}}$ where $\mathcal{F}_{\text{Dirac}}$ is a fermion Fock space over $L^2(\mathbb{R}^3; \mathbb{C}^4)$ and \mathcal{F}_{rad} is a boson Fock space over $L^2(\mathbb{R}^3 \times \{1, 2\})$. The total Hamiltonian for the system is defined by

$$\begin{aligned} H_{\text{QED}} = & H_{\text{D}} \otimes \mathbb{1} + \mathbb{1} \otimes H_{\text{rad}} + \kappa_{\text{I}} \sum_{j=1}^3 \int_{\mathbb{R}^3} \chi_{\text{I}}(\mathbf{x}) (\psi^\dagger(\mathbf{x}) \alpha^j \psi(\mathbf{x}) \otimes A_j(\mathbf{x})) d\mathbf{x} \\ & + \kappa_{\text{II}} \int_{\mathbb{R}^3 \times \mathbb{R}^3} \frac{\chi_{\text{II}}(\mathbf{x}) \chi_{\text{II}}(\mathbf{y})}{|\mathbf{x} - \mathbf{y}|} (\psi^\dagger(\mathbf{x}) \psi(\mathbf{x}) \psi^\dagger(\mathbf{y}) \psi(\mathbf{y}) \otimes \mathbb{1}) d\mathbf{x} d\mathbf{y}, \end{aligned}$$

where

$$\begin{aligned} H_{\text{D}} = & \sum_{s=\pm 1/2} \int_{\mathbb{R}^3} \omega_M(\mathbf{p}) (b_s^\dagger(\mathbf{p}) b_s(\mathbf{p}) + d_s^\dagger(\mathbf{p}) d_s(\mathbf{p})) d\mathbf{p}, \\ H_{\text{rad}} = & \sum_{r=1,2} \int_{\mathbb{R}^3} \omega(\mathbf{k}) a_r^\dagger(\mathbf{k}) a_r(\mathbf{k}) d\mathbf{k}, \end{aligned}$$

with $\omega_M(\mathbf{p}) = \sqrt{\mathbf{p}^2 + M^2}$, $M > 0$, and $\omega(\mathbf{k}) = |\mathbf{k}|$. The momentum expansions of the fields operators are

$$\begin{aligned} \psi_l(\mathbf{x}) = & \sum_{s=\pm 1/2} \frac{1}{\sqrt{(2\pi)^3}} \int_{\mathbb{R}^3} \chi_{\text{D}}(\mathbf{p}) \left(u_s^l(\mathbf{p}) b_s(\mathbf{p}) e^{i\mathbf{p} \cdot \mathbf{x}} + v_s^l(-\mathbf{p}) d_s^\dagger(\mathbf{p}) e^{-i\mathbf{p} \cdot \mathbf{x}} \right) d\mathbf{p}, \\ A_j(\mathbf{x}) = & \sum_{r=1,2} \frac{1}{\sqrt{(2\pi)^3}} \int_{\mathbb{R}^3} \frac{\chi_{\text{rad}}(\mathbf{k}) e_r^j(\mathbf{k})}{\sqrt{2\omega(\mathbf{k})}} (a_r(\mathbf{k}) e^{-i\mathbf{k} \cdot \mathbf{x}} + a_r^\dagger(\mathbf{k}) e^{-i\mathbf{k} \cdot \mathbf{x}}) d\mathbf{k}, \end{aligned}$$

respectively.

The canonical anti-commutation relations are

$$\begin{aligned}\{b_s(\mathbf{p}), b_{s'}^\dagger(\mathbf{p}')\} &= \{d_s(\mathbf{p}), d_{s'}^\dagger(\mathbf{p}')\} = \delta_{s,s'} \delta(\mathbf{p} - \mathbf{p}'), \\ \{b_s(\mathbf{p}), b_{s'}(\mathbf{p}')\} &= \{d_s(\mathbf{p}), d_{s'}(\mathbf{p}')\} = 0, \\ \{b_s^\dagger(\mathbf{p}), b_{s'}^\dagger(\mathbf{p}')\} &= \{d_s^\dagger(\mathbf{p}), d_{s'}^\dagger(\mathbf{p}')\} = \{b_s(\mathbf{p}), d_{s'}^\dagger(\mathbf{p}')\} = 0,\end{aligned}$$

where $\{X, Y\} = XY + YX$. The canonical commutation relations are

$$\begin{aligned}[a_r(\mathbf{k}), a_{r'}^\dagger(\mathbf{k}')] &= \delta_{r,r'} \delta(\mathbf{k} - \mathbf{k}'), \\ [a_r(\mathbf{k}), a_{r'}(\mathbf{k}')] &= [a_r^\dagger(\mathbf{k}), a_{r'}^\dagger(\mathbf{k}')] = 0,\end{aligned}$$

where $[X, Y] = XY - YX$.

Assume the following conditions:

(A.1 ; Ultraviolet cutoffs for Dirac field)

$$\int_{\mathbf{R}^3} |\chi_D(\mathbf{p})|^2 d\mathbf{p} < \infty.$$

(A.2 : Ultraviolet cutoffs for radiation field)

$$\int_{\mathbf{R}^3} \frac{|\chi_{\text{rad}}(\mathbf{k})|^2}{\omega(\mathbf{k})^l} d\mathbf{k} < \infty, \quad l = 1, 2.$$

(A.3 : Spatial cutoffs)

$$\int_{\mathbf{R}^3} |\chi_I(\mathbf{x})| d\mathbf{x} < \infty, \quad \int_{\mathbf{R}^3 \times \mathbf{R}^3} \frac{|\chi_{II}(\mathbf{x}) \chi_{II}(\mathbf{y})|}{|\mathbf{x} - \mathbf{y}|} d\mathbf{x} d\mathbf{y} < \infty.$$

Then H_{QED} is a self-adjoint on $\mathcal{D}(H_0)$. We are interested in the existence of the ground state of H_{QED} . Let H be a self-adjoint operator on a Hilbert space. We say that H has a ground state if the bottom of the spectrum of H is eigenvalue, i.e., $E_0(H) = \inf \sigma(H) \in \sigma_p(H)$. It is seen that $H_0(H) = H_D \otimes \mathbb{1} + \mathbb{1} \otimes H_{\text{rad}}$ has a ground state. Since the mass of the photon is zero, $E_0(H_0)$ is embedded in a continuous spectrum.

Dimassi-Guillot [6] and Brouxbaroux-Dimassi-Guillot [3] consider a QED model with generalized perturbations, and proved the existence of the ground state for sufficiently small values of coupling constants. In [11], the existence of the ground state H_{QED} was proven for sufficiently small values of coupling constants. The main purpose in the paper [13] is to prove the existence of the ground state H_{QED} for all values of coupling constants.

(A.4 : Momentum regularization of Dirac field)

$$\int_{\mathbb{R}^3} |\partial_{p^\nu} \chi_D(\mathbf{p})|^2 d\mathbf{p} < \infty, \quad \int_{\mathbb{R}^3} |\chi_D(\mathbf{p}) \partial_{p^\nu} u_s^l(\mathbf{p})|^2 d\mathbf{p} < \infty, \quad \int_{\mathbb{R}^3} |\chi_D(\mathbf{p}) \partial_{p^\nu} v_s^l(-\mathbf{p})|^2 d\mathbf{p} < \infty.$$

(A.5 : Momentum regularization of radiation field)

$$\int_{\mathbb{R}^3} \frac{|\chi_{\text{rad}}(\mathbf{k})|^2}{|\mathbf{k}|^5} d\mathbf{k} < \infty, \quad \int_{\mathbb{R}^3} \frac{|\partial_{k^\nu} \chi_{\text{rad}}(\mathbf{k})|^2}{|\mathbf{k}|^3} d\mathbf{k} < \infty, \quad \int_{\mathbb{R}^3} \frac{|\chi_{\text{rad}}(\mathbf{k}) \partial_{k^\nu} e_r^l(\mathbf{k})|^2}{|\mathbf{k}|^3} d\mathbf{k} < \infty.$$

(A.6 :Spatial localization)

$$\int_{\mathbb{R}^3} |\mathbf{x}| |\chi_I(\mathbf{x})| d\mathbf{x} < \infty, \quad \int_{\mathbb{R}^3 \times \mathbb{R}^3} \frac{|\chi_{II}(\mathbf{x}) \chi_{II}(\mathbf{y})|}{|\mathbf{x} - \mathbf{y}|} |\mathbf{x}| d\mathbf{x} d\mathbf{y} < \infty.$$

The main theorem in [13] is as follows:

Theorem ([13];Theorem 2.1)

Assume (A.1)-(A.6). Then H_{QED} has a ground state. In particular, its multiplicity is finite.

[Remaining Problems]

(i) Self-adjointness without cutoffs

It is seen that under momentum cutoffs (A.1),(A.2) and spatial cutoffs (A.3), H_{QED} is self-adjoint. For the Nelson model, which describes the non-relativistic particles coupled to a scalar field, it was proven that by subtracting momentum divergence terms from the Hamiltonian, there is a unique self-adjoint Hamiltonian [10].

(ii) Infrared divergence

The condition $\int_{\mathbb{R}^3} \frac{|\chi_{\text{rad}}(\mathbf{k})|^2}{|\mathbf{k}|^5} d\mathbf{k} < \infty$ in (A.5) is stronger than the standard infrared regularity condition. Non-relativistic QED model [2, 7] and spin-boson model [8] have the ground state without infrared cutoffs. On the other hand, the non-existence of the ground state for massless Nelson-model (see e.g.,[5]) and the Generalized spin-boson model [1] were investigated.

(iii) Multiplicity

We see that multiplicity of the ground state of H_{QED} is finite for all values of coupling constants. In [9], the multiplicity of the ground state for various quantum field models was investigated for sufficiently small values of coupling constants.

(iv) Asymptotic Completeness

In [11], the existence of asymptotic field for the Dirac field and the radiation fields was proven, however its asymptotic completeness has not been shown (see e.g. [4])
